

Maximum lifespan by usage intensity

At Camso we believe that to achieve the lowest operating cost solution, you need to have the right tire for your application. To deliver on this promise, determining the usage intensity of your operation is key. Understanding the intensity of your application is essential to maximizing tire life and ultimately, the return on your tire investment.

The Usage Intensity Calculator is a fact-based online tool, built on thousands of hours of testing, that takes into account parameters such as lift capacity, working environment, as well as idle, travel and manoeuvring time to determine a forklift's application intensity, and recommend the best solution for that specific application.

Find the right tire
for your usage intensity at
